

Basketball App

Once the app is running this screen will appear. The basketball will start to fall towards the bottom of the screen.

Since this is ran using an emulator, I cannot physically rotate the phone 90 degrees so I will use a feature on the emulator that allows you to rotate. It is on the side panel menu. Once clicked the phone will rotate and the ball will then move towards the new bottom of the screen.

The phone can keep being rotated and the ball will interact with the new orientation. Here is one last example of the phone being turned upside down.
