

Weather Demo

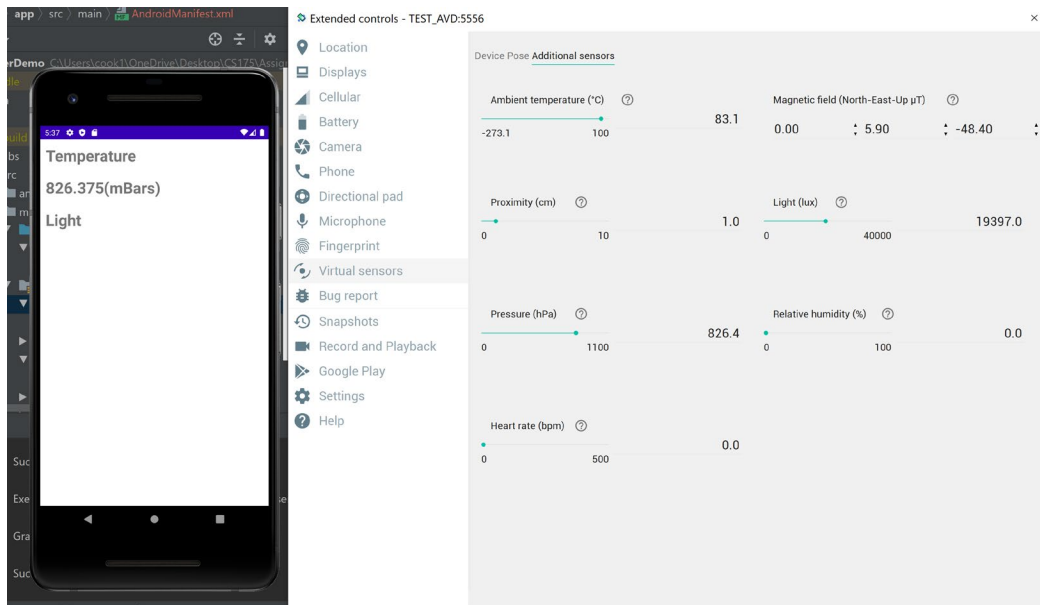

Once the app is running it will appear like so, it does not have the values for temperature and light because I am using emulator and there is no default value for them.

In order to check to see if those textviews work accordingly, you must go into the extended controls by clicking on the 3 dots at the bottom of the menu on the right side.

Then click additional sensors at the top

Now the light, pressure, and temperature can be adjusted with these controls and the app should update and show the new values once a change is made.
